

Secure Voice over Internet Protocol: www.secvoip.de

Which Hardware can be used?

Unfortunately, not every VoIP-telephone or soft-client is capable to perform these encryptions. After numerous tests we found two telephony solutions that satisfy the high demands. We recommend fully encrypted communications that use VoIP phone solutions:

1. Hardware Phone: SNOM 320 (SNOM 370)
2. Software phone: PhonerLite

Also possible is unencrypted use of our server as a "normal" SIP server. In this case all market available SIP-based telephony clients are functional.

A first illustration of SecVoIP's internet presence shows the picture below.
